Application FC01

Single Channel Flow Computer

for Volumetric Frequency or Analog **Flowmeters**

Features

- Tailored to suit volumetric flowmeters
- Programmable for either frequency or analog flow input
- Uses a live or fixed density value for volume to mass calculations
- Versatile "user value" available on main menu
- Selection of Detail or Basic main menu to suit operator and application
- Selection of second language and user tags
- RTC logging with over 1000
- Programmable pulse width and scaling of pulse output
- 4-20mA retransmission
- RS232 and RS485 or Ethernet (optional) serial ports
- Modbus RTU, Printer and other serial port protocols

Overview

The 515 FC01 application pack is a rate totaliser for the measurement of a fluid using the frequency or analog volumetric flow signal output from a wide range of flowmeters.

The flow computer can calculate and display the flow rate, resettable total and the accumulated total for volume and mass, using a live or fixed density for the conversion.

The frequency input is compatible with a wide range of frequency signals, including millivolt signals. reed switches, Namur proximity switches and pulse trains via its smart front-panel program selection. The analog input can be scaled and have filtering, square law, non-linear correction and cutoff points applied to the signal.

A freely programmable "user value" on the main menu can serve as a setpoint for the 4-20mA output or as an operator identifier to be logged.

Calculations

For the frequency input the calculation of volume total is exact as the instrument collects all pulses detected on the input.

volume total = pulses / k-factor

The flow rates are derived from an accurately measured frequency:

volume flow = frequency / k-factor

For the analog input, to derive the flow rate, the analog signal is normalised to a value (A) between 0 and 1.

 $volume\ flow = (V_f max - V_f min)A + V_f min$

$$total = \int (flow \cdot \Delta t)$$

Density is used to calculate the mass flow and total:

mass = volume x density

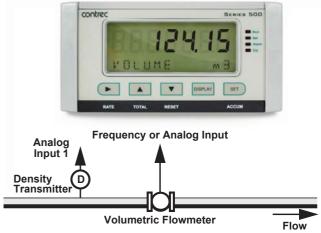

Displayed Information

The front panel display shows the current values of the input variables and the results of the calculations. A list of the variables for this application and their type (total or rate) is shown at the end of this document.

The instrument can be supplied with a real-time clock for data logging of over 1000 entries of the variables as displayed on the main menu.

Communications

There are two communication ports available as follows:

- COM-1 RS-232 port
- COM-2 RS-485 port (optional) or Ethernet (optional)

All types of ports can be used for remote data reading, while RS-232 and RS-485 serial ports can be used for printouts and for uploading and downloading of the application software to the instrument.

Isolated Outputs

The opto-isolated outputs can re-transmit any main menu variable. The type of output is determined by the nature of the assigned variable. Totals are output as pulses and rates are output as 4-20 mA signals. One output is standard, a second output is available as an option.

Relay Outputs

The relay alarms can be assigned to any of the main menu variables of a rate type. The alarms can be fully configured including hysteresis. Two relays are standard with two additional relays available as an option.

Software Configuration

The instrument can be programmed to suit the particular application needs and the flexible I/O can be assigned as required. Program settings can be changed either via the front panel (depending on assigned access levels) or via the 500 Series Program Manager (500-PM software).

The instrument stores all set-up parameters, totals and logged data in non-volatile memory with at least 30 years retention.

For conformal coated 'C' version, type BR2032

manufactured by Panasonic only - For non-conformal coated versions, type

BR2032 and CR2032 manufactured by

Panasonic or Sony

Battery Life 5 years (typical)

Frequency Input (General)

0 to 10kHz for Pulse input type 0 to 5 kHz for Coil & NPS input types Range

Overvoltage 30V maximum 0.3 sec **Update Time**

Cutoff frequency Programmable

Configuration Pulse, coil or NPS input Non-linearity Up to 10 correction points

Pulse

Signal Type CMOS, TTL, open collector, reed switch

Threshold Signals switch below 1.3 & above 2 volts

Coil

Turbine and sine wave Signal Type

Sensitivity 15mV minimum amplitude (typical)

NPS

Signal Type NPS sensor to Namur standard

Analog Input (General)

100 mA absolute maximum rating (30 mA for 4-20 mA inputs) Overcurrent

Update Time < 1.0 sec

Configuration 4-20mA, 0-5V and 1-5V input

Non-linearity Up to 20 correction points (some inputs)

4-20 mA Input

Impedance 100 Ohms (to common signal ground)

0.05% full scale (20°C) **Accuracy**

0.1% (full temperature range, typical)

0-5 or 1-5 Volts Input

10MOhms (to common signal ground) Impedance

0.05% full scale (20°C) Accuracy

0.1% (full temperature range, typical)

Logic Inputs

CMOS, TTL, open collector, reed switch Signal Type

Overvoltage 30V maximum

Relay Output

No. of Outputs 2 relays plus 2 optional relays

250 volts AC, 30 volts DC maximum Voltage

(solid state relays use AC only)

3A maximum - mechanical relays Current

1.5A maximum - solid state relays

Communication Ports

Ports

COM-1 RS-232 port COM-2 RS-485 or Ethernet port (optional)

Baud Rate 2400 to 19200 baud **Parity** Odd, even or none
