Overview

The 515 FP01 application measures the flow and consumption of petroleum and other fluids. The two-channel frequency flow input enables the instrument to calculate the "resultant" net volume that is used in system or a consuming device.

Each channel has an analog temperature input that allows for volume correction to reference conditions. The calculation mode can be subtraction or addition. Subtraction mode can be for a consuming device and it is expected that the feed (flow 1) will be greater than the return (flow 2). Addition mode can be used to cascade instruments or combine flows to get total consumption.

This instrument is suited for range of crude and refined petroleum fluids including gasoline, jet fuels, heating oils, diesels, lube oils and LPGs. Volume correction is also available for gasohol and ethanol products and other fluids can be calculated by a General Coefficient of Expansion or a Preprogrammed User Table.

Calculations

The volume total and flowrate are derived from accurately measured frequency and the number of received pulses.

gross volume = pulses / k-factor
gross volume flow = frequency / k-factor

Resultant net volume:
Consumption volume = Net Vol1 - Net Vol2
Combined volume = Net Vol1 + Net Vol2

The volume correction calculations are based on the ASTM D1250-04 and API Table 54, MPMS 11.3.4-2019, ABNT NBR 15639-2016 standards for the following products:

- Crude Oils
- Lube Oils
- Refined Products
- Special Applications
- Light Hydrocarbon Liquids (LPG)
- Gasohol Blends
- Ethanol Mixtures with Water

Displayed Information

The front panel display shows the current values of the input variables and the results of the calculations. A list of the variables for this application and their type (total or rate) is shown at the end of this document.

The instrument can be supplied with a real-time clock for data logging of over 1000 entries of the variables as displayed on the main menu.

Communications

There are two communication ports available as follows:

- COM-1 RS-232 port
- COM-2 RS-485 port (optional) or Ethernet (optional)

All types of ports can be used for remote data reading, while RS-232 and RS-485 serial ports can be used for printouts and for uploading and downloading of the application software to the instrument.

Isolated Outputs

The opto-isolated outputs can re-transmit any main menu variable. The type of output is determined by the nature of the assigned variable. Totals are output as pulses and rates are output as 4-20 mA signals. One output is standard, a second output is available as an option.

Relay Outputs

The relay alarms can be assigned to any of the main menu variables of a rate type. The alarms can be fully configured including hysteresis. Two relays are standard with two additional relays available as an option.

Software Configuration

The instrument can be programmed to suit the particular application needs and the flexible I/O can be assigned as required. Program settings can be changed either via the front panel (depending on assigned access levels) or via the 500 Series Program Manager (500-PM software).

The instrument stores all set-up parameters, totals and logged data in non-volatile memory with at least 30 years retention.

Analog Input Types

Any analog input can be set to accept a 4-20 mA, 0-5 V or 1-5 V signal, while any inputs assigned to a temperature sensor can also be set to accept a PT100 or PT500 signal.
